TITLE: Matrix control devices for multichannel analyzers ✓

SOURCE: Ref. zh. Avtomatika, telemekhanika i vychislitel'naya tekhnika, Abs. 11B228

REF SOURCE: Tr. Soyuzn. n.-i. in-ta priborostr., vyp. 1, 1964, 131-142

TOPIC TAGS: multichannel analyzer, matrix control, digital computer, computer component

ABSTRACT: Linear, decoder, and matrix control devices for multichannel measuring systems are analyzed. It is inferred that the matrix type (when the number of command cycles exceeds 16) is expedient for use in new analyzers. Two control devices, BUU-16<sup>4</sup> and BUU-17<sup>4</sup> are detailed, their functional diagrams are presented as well as their basic data. Operation of these units is examined: a shaping amplifier with or without an OR-gate; address-current generator with a program switch. Tests and operating-experience results are reported. The above control device was physically implemented in AI-1024-1, AI-1024-2, and AI-2048<sup>4</sup> analyzers. Nine figures. Bibliography of 4 titles. N. P. [Translation of abstract] ✓

TITLE: A kit of units and blocks for multichannel and multidimensional analyzers

SOURCE: Ref zh. Fizika, Abs. 3A408

REF SOURCE: Tr. Soyuzn. n.-i. in-ta priborostr., vyp. 1, 1964, 63-78

TOPIC TAGS: multichannel analyzer, pulse height analyzer, computer component, computer coding/ BAP amplitude code converter, BVP time code converter, BDP coordinate code converter, BZU memory unit, BAU arithmetic unit, BUU control unit, BZ printer, BZ perforator, BZ tape storage, BO oscilloscope block, BUO oscilloscope control

ABSTRACT: The authors consider the characteristics of a kit of units and blocks for multichannel and multidimensional analyzers.<sup>1</sup> All the units of the kit are matched both with respect to the input and output resistances, accuracy, range of measured quantities, and operating speed. The parameters of the blocks are guaranteed at a temperature  $20 \pm 15^\circ\text{C}$  and a relative humidity  $70 \pm 10\%$ . The blocks are designed for supply voltages 6, 12, 27, and 100V, with stability  $\pm 0.5\%$ . The kit includes the following: input units, circuits for the accumulation and processing of information, output devices, and power supplies. The parameters of the following units are presented: 1) BAP-5<sup>2</sup> and BAP-7<sup>3</sup> pulse amplitude into code converters; 2) BVP-5<sup>2</sup> time intervals into digital code converters; 3) devices BDP-7<sup>4</sup> and BDP-8<sup>5</sup> for the transformation of the coordinates of pickups, targets, samples, etc. into a digital code; 4) BZU-15,<sup>6</sup>

TITLE: Perspectives on the development and uses of aluminum alloys

SOURCE: AN SSSR, Institut metallurgii. Metallovedeniye legkikh splavov (Metallurgy of light alloys). Moscow, Izd-vo Nauka, 1965, 188-196

TOPIC TAGS: aluminum, aluminum alloy, economics, economic program

ABSTRACT: A general survey of the present status and future development of the aluminum alloys industry is presented. Frequent reference is made to the U. S. aluminum industry. For example, it is pointed out that whereas prices for copper and cast iron increased by 30% and 31% respectively over the period from 1938 to 1964, the increase in the price of aluminum over the same period was only 11%. It is also mentioned that the U. S. defense industry used a smaller fraction of the total aluminum produced in the country in 1963 (7.3%) than in 1950 (34.5%). The author attributes the price stability and changing trends in the uses of aluminum in the USA to new production techniques and new areas of application, particularly in the construction industry. The author expresses hope that the huge power installation in the Far East of Russia, coupled with new manufacturing processes, will further

L 37162-66

decrease the price of aluminum production and make the metal and its alloys more widely available in all branches of the nation's industry. Orig. art. has: 2 tables.

TOPIC TAGS: pulse height analyzer, spectrum analysis/*AI-1024-3 analyzer, AI-2048-3 analyzer, AI-4096-3 analyzer, AI-2048-1*

ABSTRACT: Various methods are considered of identification of complex spectra which can be materialized by means of pulse-height analyzers AI-1024-3, AI-2048-3, AI-4096-3, and AI-2048-1. The identification methods are reduced to a comparison of the test spectrum with several standard spectra. The most widely used method is normalization, e. i., a sequential subtraction of standard spectra from the test one. The second group of methods are matrix methods and their modification -- a method of counting efficiencies. These methods are less widely used, apparently, because of the complicated problem arising from incorrect equations involved. Recently, regulating methods were suggested for this class of problems. TITLE: Standard programs for normalization of spectra for AI-1024, AI-2048, AI-4096 analyzers

SOURCE: Ref. zh. Avtomat. telemekh. i vychisl. tekhn., Abs. 11A376

REF SOURCE: Tr. 6-y Nauchno-tekhn. konferentsii po yadern. radioelektron. T. 3. Ch. 2. M., Atomizdat, 1965, 154-161

TOPIC TAGS: pulse height analyzer, spectrum analysis /AI-1024 analyzer, AI - 2048  
and, in AI-4096 analyzer

ABSTRACT: Quantitative interpretation of the results of statistical spectrum measurements depends on many factors connected with variety of measurement conditions. To allow for these conditions, the spectra are normalized, e. i., changed to a form in which they become comparable. Simplest, widely used methods of spectrum normalization are considered, and the programs of their utilization with AI-1024, AI-2048, and AI-4096 analyzers are examined. The same normalization methods can be used also with AI-16000. The number-of-readings spectrum normalization can be reduced to multiplication or division of the spectrum in each analyzer channel by a constant factor. The multiplication or division factors are set on the control desk. The multiplication and division programs are conventional. The energy-axis is associated with instability of the spectrometric channel. The spectrum-normalization programs can be used by the analyzers as self-contained programs of spectrum pre-processing or they may be used as subroutines in more complex programs of spectrum processing. Digital analog computer, computer input unit

TOPIC TAGS: pulse height analyzer // AI-1024 analyzer, AI-2048 analyzer, AI-4096  
analyzer

ABSTRACT: These analyzers permit several types of measurement, yield information either in analog or in digital form, can process information, and perform simplest checking operations. They permit carrying out rapid time and two-dimensional analyses of the following forms: pulse-height and time analysis in consecutive time intervals, measurement of flux intensity at several points in consecutive time intervals, pulse-height-height analysis, pulse-height-time analysis, time-time analysis, pulse-height analysis of several independent random processes by means of several sensors, time analysis by means of several sensors. The connections required by each type of measurement are made automatically when the suitable input unit is set in. The

Card 1/2

UDC: 658.562:533

ACC NR: AR7004313

analyzer can be started either manually or by an external signal. The analyzer can be stopped either manually, or by an external signal, or by a specified-exposure signal. The exposure can be specified: either by a "live" time, or by a specified number of pulses, or by a specified time lapse. The analog-type information is fed to an oscilloscope and a recorder. A number code taken from a given channel is fed to a register and further (in a potential digital form) is transferred to the oscilloscope control unit where a digital-to-analog converter is located. When the information is fed to the recorder, an integrating unit is also used. The information is fed to the oscilloscope and recorder according to a conventional program. The information is delivered at a rate of 5 or 20 lines per second. After one cycle of information has been completed, the next pulse starts a program of converting the number in the next channel. Check routines are used for checking the normal functioning of the analyzer. Eleven figures. Bibliography of 4 titles. B. U.

TITLE: Device for producing an axonometric image of the spectrum. Class 42, No. 188148 [announced by Union Scientific Research Institute for Instrument Manufacture (Soyuznyy nauchno-issledovatel'skiy institut priborostroyeniya)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 21, 1966, 158

TOPIC TAGS: spectrum, transistorized circuit, SPECTRUM ANALYZER

ABSTRACT: This Author Certificate presents a device for producing an axonometric image of the spectrum, which contains code-to-voltage converters, amplifiers, and a cathode ray tube. To simplify the device, the amplifiers are connected at the output of the code-to-voltage converters. A common summing transistor in each amplifier is connected directly to a first current-setting transistor and (through a multiposition switch) to a second current-setting transistor. The base of the summing transistor in the amplifiers is connected to a reference voltage source. Limiting resistors are connected in the emitter circuits of the first and second current-setting transistors. To increase the image visualization, the emitter of the first summing transistor is connected through a switch to the collector of a transistor whose emitter

ACC NR: AP7001437

is connected to a resistor. Its base is connected to the base of the first current-setting transistor and to the output of the voltage source for varying the third coordinate.

ACCESSION NR: AP5001265

national Conference on Peaceful Uses of Atomic Energy, 1964. It describes an installation of a reactor in which organic liquid serves as the coolant, and as the moderator. The low-power reactors of about 5 Mw are expected to be economical in the remote regions where the usual energy sources are not available. A regeneration system is described for the coolant which removes the products of radioysis. Orig. art. has: 7 figures

AUTHORS: Tereshin, O.N. and Belov, A.S.  
TITLE: Decoupling of Slot-Type Antennas by Means of an Impedance Structure Situated in the Plane of the Slots  
PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiotekhnika, 1960, No.3, pp.359-365

TEXT: In practice, it is often necessary to secure a sufficient decoupling between the receiving and the transmitting antennas of the slot-type which are situated in the same plane in the vicinity of each other. It is necessary for the decoupling device to be situated in the plane of the antennas. A method of producing the decoupling by means of a plane impedance structure (surface) situated between the antennas is analysed. A uniform infinite (in the direction of x) impedance surface situated in the plane XOY is considered. The antennas are assumed to be uniform in the direction of x. If the distance between the thresholds of the individual grooves of the impedance structure are much smaller than the wavelength it can be assumed that

E192/E482Decoupling of Slot-Type Antennas by Means of an Impedance  
Structure Situated in the Plane of the Slots

$$\left. \frac{E_x}{H_y} \right|_{z=0} = 0 \quad (1)$$

The characteristic surface impedance is given by

$$Z(y) = \left. \frac{E_y}{H_x} \right|_{z=0} \quad (2)$$

This can also be expressed by (Ref.1):

Eq.  
(3)

$$Z(y) = \frac{i}{\omega \epsilon} \frac{\int_{-\infty}^y \frac{x_s^s(z) - F_1^s(z) - F_2^s(z)}{z} e^{-iy} dz}{\int_{-\infty}^y \frac{x_s^s(z) - F_1^s(z) + F_2^s(z)}{z} e^{-iy} dz}. \quad (3)$$

Card 2/6

## Decoupling of Slot-Type Antennas by Means of an Impedance Structure Situated in the Plane of the Slots

where  $Z(y)$  is the surface impedance,  $\omega$  is the angular frequency,  $\epsilon$  is the permittivity of the medium above the impedance surface,  $k$  is the wave number in the space above the impedance surface,  $\tilde{E}(y)$  is the directional pattern function of the system and  $\Upsilon = \sqrt{\omega^2 - k^2}$ . The functions  $F$  of Eq.(5) represent the spectral densities and are defined by Eq.(4), where the symbols  $J$  represent the components of the volume density of electric and magnetic currents,  $z'$  and  $y'$  are the coordinates of the primary sources, while  $z$  and  $y$  are the coordinates of the observation point. At the points where the external currents are absent, the expression for the surface impedance can be written in a simplified form as given by Eq.(5). This expression can be normalized by introducing  $\kappa = \omega/k$ . In this case the normalized impedance is expressed by Eq.(6). From Eq.(5) or (6) it is seen that the decoupling can be achieved by reducing the denominator in these equations. If the denominator is denoted by a function  $\varphi(y)$ , the function  $\tilde{E}(y)$  can be expressed by Eq.(10). Now the

Card 3/6

86793

S/142/60/000/003/003/017  
E192/E482

## Decoupling of Slot-Type Antennas by Means of an Impedance Structure Situated in the Plane of the Slots

final expression for the surface impedance is

Eq.  
(11)

$$Z(y) = -\frac{1}{2} \frac{\int_0^\infty \varphi(t) \frac{H_1^{(1)}(t-y)}{t-y} dt}{\varphi(y)}. \quad (11)$$

This formula gives the necessary impedance distribution for securing the desired field attenuation function  $\varphi(y)$ . It is assumed that  $\varphi(y)$  is in the form of Eq.(14) where  $f(y)$  is an analytic function free from singularities in the upper semi-plane. By contour integration of Eq.(11), it is found that the surface impedance is given by Eq.(15). From this it is seen that the greater the attenuation of the field the greater the decrease in the impedance. It is desirable that the surface impedance should

Card 4/6

86793

S/142/60/000/003/008/017  
E192/E482

Decoupling of Slot-Type Antennas by Means of an Impedance  
Structure Situated in the Plane of the Slots

be purely reactive since this can be simply achieved by means of a simple periodic (corrugated) structure. The theory was verified by some experiments where the following parameters were chosen for Eq.(15):  $f(y) = \text{const}$  and  $a = 0$ . This corresponds to a purely resistive surface impedance which can be simply realized in practice. The experiments were done at the wavelength of 3.2 cm and the system consisted of a number of grooves filled with different dielectrics and absorption materials. The structure had a width of 2.5 mm and length of 250 mm. The index  $n$  was taken as being equal to 3 and up to 6 grooves were used. It was found that with 3 grooves, the attenuation was 33 db, with 6 grooves the attenuation increased to 44 db (calculated value being 80 db). If the above corrugated structure was replaced by a metal sheet the decoupling was about 20 db. There are 4 figures and 3 Soviet references.

TITLE: Features of machining fir-tree surfaces on lathes  
PERIODICAL: Energomashinostroyeniye, no.2, 1962, 37-38  
TEXT: The Nevskiy mashinistroitel'nyy zavod im. V.I. Lenina (Neva Works im. V.I. Lenin) makes forged drums for gas-turbine rotors and axial compressors 4-5 metres long, weighing about six tons and also various blanks in the form of rings for blades and the like. Most of these parts are made of high-alloy stainless and heat-resisting steels grade 34XH3M (34KhN3M), 2X13 (2Kh13), 3M 405 (EI405) and 3M 415 (EI415). High accuracy and good surface finish is required. The profiles are cut with toothed high-speed tools of high accuracy and good surface finish. Two tools are normally used, one for roughing, the other for finishing. For the shafts of axial compressors, the finishing tool has teeth on both sides and for rings it has teeth on one. Rotors of axial compressors which are relatively long and thin may vibrate during machining and to avoid this the lathe speed should be reduced as

AUTHOR: Belov, A. V.

TITLE: High-Efficiency Metal Working by Cutting

PERIODICAL: Tr. Nevsk. Mashinostroit. z-da, 1958, No. 3, pp. 58-75

TEXT: The author describes highly productive methods of machining components, used at the Nevskiy mashinostroitel'nyy zavod (Nevskiy Mechanical Engineering Plant). Formerly, the machining of stepped shafts made of the steel grades 45, 40X (40Kh), 40H (40N), 3M415 (EI415) and 3M405 (EI405) was effected at low cutting rates because the shafts could not be properly clamped on the machine tools. The author presents a new method of fastening the shafts by clamping their left end in a special 4-jawed chuck with spherical jaws, while the right end is fitted in a roller bearing, fastened in a steady. This method of clamping the shafts made it possible to machine them at high cutting rates, using T15K6 and T30K4 carbide cutting tools (during semi-finish stepped turning of the partition part the feed was 0.6-0.8 mm/rev [Translator's note: the word

Card 1/2

High-Efficiency Metal Working by Cutting

A004/A002

"plavayushchiye" is being used in the abstract, an obvious misprint instead of the word "podacha" -"feed"] cutting depth = 8-10; during finish machining the cutting feed was 250-400 m/min, the feed = 0.1-0.2 mm/rev and the cutting depth = 0.5-0.75 mm). The authors present new designs of aperture-forming cutting tools (laminated countersink reamers, broaches with stepped grinding of the partition part, floating boring bits), which made it possible to machine the apertures in turbine parts at increased cutting rates under consideration of increased demands as to accuracy (2nd - 3rd class) and surface finish ( $\nabla\nabla 6$  -  $\nabla\nabla 8$ ). The author describes a new grinding geometry of carbide threading tools with fitted adjustable chip curler. The use of such tools increased their durability, reduced the number of cutting operations (3-4 instead of 8-10) and made it possible to cut threads at high cutting speeds (60-70 m/min). A description is given of surface planing with the aid of wide cutting tools tipped with the BK8 (VK8) grade carbide. The designs of end milling heads used for high-speed plane face milling and the cutting conditions are given. There are 17 figures and 5 tables.

MPD-6 Metal Washers (Opyt primeneniya gidroelektorov na  
metallicheskikh promyshlenniykh priborakh MPD-2 i MPD-6)

PERIODICAL: Kolyma, 1956, Nr 12, pp 26-28

ABSTRACT: The desirability of using hydraulic elevators, which combine the advantages of reliability in operation, small dimensions and ease of assembly and dis-assembly, has been shown in practice. The only repair cost incurred with hydraulic elevators is the replacement of the orifice and lining once per season. The service life of a hydraulic elevator is increased by using 10-mm thick chilled cast iron for the lining. Thick-walled 200 mm tubing has to be used both for the water and the pulp lines. In assembling the water supply line for a hydraulic elevator, a stub pipe for a pressure gauge must be provided. Washers using hydraulic elevators should be equipped with the more economical 6NDV pump instead of the 8NDV.
